To Whom It May Concern,

Good day! I came across Clever Inc whilst doing research about leaders in the edtech industry. Education has always been my passion in life. I recently took a 6 month hiatus from the corporate world to spend some time teaching in South America. As fulfilling as that experience was, I realized my ability to write and develop code has the potential to be much more influential on the education technology space than any amount of teaching. After having worked for Amazon as a software engineer for around 3 years, I realized the next step in my career needed to be in the edtech space. Clever Inc especially has stood out as an edtech company that knows how to embrace and utilize engineering to their advantage. There also seems to be a true passion to improve education which is a company culture I would love to be a part of.

At Amazon, I spent time working both front-end and back-end and developing at all stages of the stack. I specifically worked on implementing several APIs as well as calling them from the front-end. I would love to develop and maintain exciting features for Clever whether that is in the form of UI, Go Microservices or RESTful APIs. I also find that I am naturally very passionate about your company's engineering tenets, especially "Learn and Teach, Every Day." Based on the software engineer role requirements and the overall company culture, I think I'd be a great candidate for this position and would love for you to take a look at my resume.

I would be happy to set up an initial screening call or interview whenever your team is available. I hope to hear from you soon!

Sincerely,

Kason
